

# POWER FLUSHING

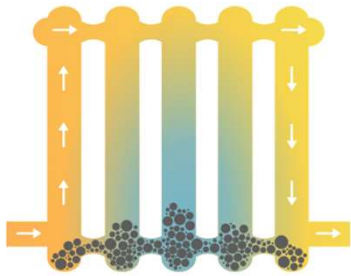

Why you may need a power flush and how does it work?

# WHY YOU MAY NEED A POWER FLUSH

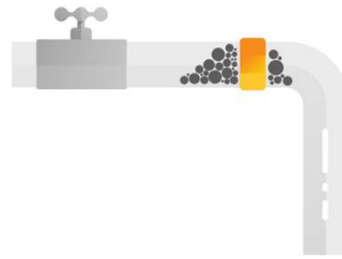

Are you experiencing any of the following signs on your central heating?

- Cold spots on your radiators
- Radiators cold at the top
- Radiators cold at the bottom
- Blocked pipes due to Sludge and/or limescale
- Blocked radiator valves due to Sludge and/or limescale
- Blocked central heating control valves due to Sludge and/or limescale
- Banging noises from the Boiler
- Noisy pipes due to restrictions in flow
- Boiler cutting out due to blocked or damaged pump

# PROBLEMS YOU MAY BE EXPERIENCING

Sludge causes cold spots in radiators and means your central heating has to work harder to heat your room to your desired temperature costing you more money.

Sludge, rust and limescale causes blockages in pipes & valves leading to leaks & system shut down.

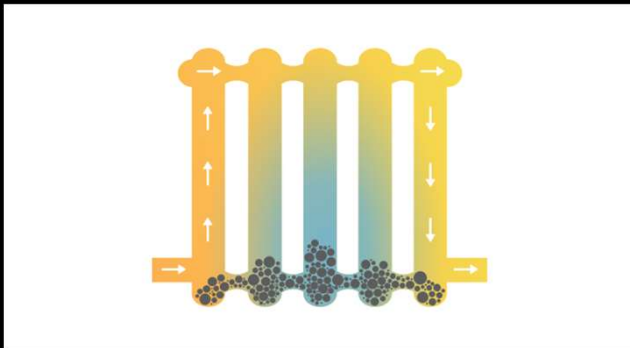

Clogged boiler and pumps lead to break downs.

# HOW DOES POWER FLUSHING WORK?

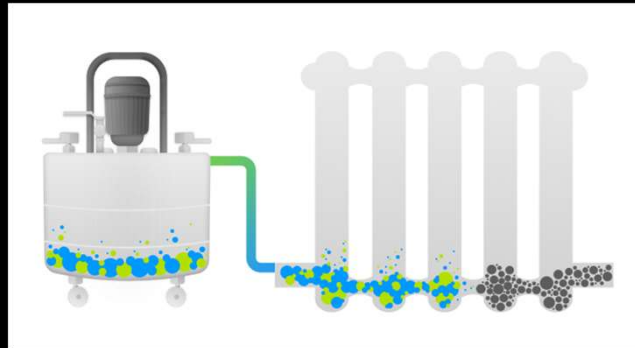

## BEFORE

The Sludge creates cold spots (indicated by the blue area in the image below) and blockages so heat cannot flow round your central heating system effectively and can cause pump seizures and system failure.

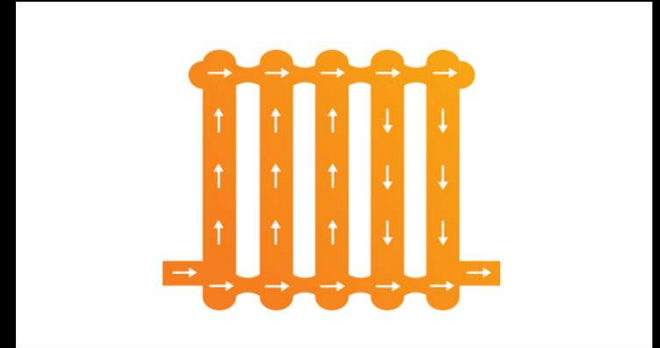

## DURING

A machine and a three step chemical process flushes the sludge, rust and limescale build up out of your central heating system cleaning your boiler, pipes, valves and radiators and replaces it with clean water.

## AFTER

Once the Power flush has been completed successfully your pipes, radiators, valves and boiler should work much more efficiently and effectively heating up faster, wasting less energy and helps protect your boiler.

# HOW DO I BOOK?

Home Gas Supplies

Unit 6 Waterfall Mill, Queen Victoria Street, Blackburn, Lancashire BB2 2QG

Tel: 01254-676118 E-mail: [web@homegassupplies.co.uk](mailto:web@homegassupplies.co.uk) / [showrooms@homegassupplies.co.uk](mailto:showrooms@homegassupplies.co.uk)
